

Safyr 7.7.11 New Features

October 2022 © Silwood Technology Ltd

Introduction

Safyr 7.7.11 adds SuccessFactors as a 'source' system for metadata extraction, and introduces new capabilities to enable export of SAP metadata to Data Catalogs with multi-language definitions.

A range of other minor enhancements are included in this release, including support for version 55 of the Salesforce Metadata API.

Please see the Safyr 7.7.11 Release Notes for full details of the improvements and fixes.

Success Factors and Safyr

Safyr can now extract data definitions from SuccessFactors systems. This is achieved by reading the OData definitions for a SuccessFactors system and representing that in the Safyr repository structure.

The standard Safyr features for searching, creation of Subject Areas, and export to the various export formats supported are available, as for any of the other 'source' system types like SAP and Salesforce.

SAP Multi-language support for data catalogs

SAP systems like S/4HANA provide multi-language definitions for 'objects' like Tables and Fields.

With the new Safyr release, users exporting to data catalogs can choose up to 3 additional languages for the provision of language definitions into the target environment.

Full details of these new features can be found in the Safyr manuals.

Upgrading to Safyr 7.7.11

Please read the *Safyr 7.7.11 Release Notes*, available on the Safyr Support area for full details of how to upgrade to this release.

Please check with our support group (<u>support@silwoodtechnology.com</u>) if you require more details of the upgrade process.
